

***-Reading Comprehension:**

Read the following text about "Brain power" Then do the tasks below.

The brain is the most complicated part of the body. It takes up 2% of our body weight but uses 20% of our energy supply. It receives information and sends out messages to control our behaviour and movements. It allows us to think, learn and remember. The brain floats in liquid and the hard skull protects it. The adult brain weighs around 1.4 kilograms – but a six year- old's brain is already adult sized! Your brain is divided into three main parts. The smallest part controls breathing and digestion. The middle part controls movement. The biggest part controls intelligence, the senses and memory. Different sections of this part are responsible for different things. These include smell, sight, touch, music and language. Scientists study brains while people are doing activities, such as talking. They can see which part of the brain is used. The brain is also divided into two halves: _ The left side controls the right side of the body. In most people this side is used for creative activities. _ The right side controls the left side of the body. In most people this side is used for logical activities such as maths.

I-Answer these questions. {20 marks}

- 1- What is the most complicated part of the body?
- 2- Why does the brain receives information and sends out messages?
- 3- What protects the brain?
